## **Symmetry in mathematics**

Symmetry occurs not only in geometry, but also in other branches of mathematics. Symmetry is a type of invariance: the property that something does not change under a set of transformations. Given a structured object X of any sort, a symmetry is a mapping of the object onto itself which preserves the structure.

There can also be symmetry in one object, such as a face. If you draw a line of symmetry down the center of your face, you can see that the left side is a mirror image of the right side.

Symmetry is all around us! It occurs regularly in nature and is used in art, design, and math especially the field of geometry. If you want to introduce the concept of symmetry to you children ...

## **Types of Symmetry | Linear Symmetry| Point Symmetry ...**

We will learn about all types of symmetry of various shapes in geometry. The explanation will help us to understand the different types of symmetrical shapes which possess or does not possess linear symmetry, point symmetry and rotational symmetry.

## **Symmetry – Reflection and Rotation**

We do have an idea about what symmetry is! But what's rotational symmetry? Is it easy to find the order of rotational symmetry? Watch this video to know more :)

## **Symmetry Reflection and Rotation Math is Fun**

The Line of Symmetry can be in any direction (not just up down or left right). To learn more, go to Reflection Symmetry. Rotational Symmetry. With Rotational Symmetry, the image is rotated (around a central point) so that it appears 2 or more times.

This type of symmetry is called reflective symmetry. A shape can also have rotational symmetry, where you can rotate the shape and it still exactly fits into its own outline. A shape that is not symmetrical is referred to as asymmetrical.
