I really like when the students say the midline since this will help when we graph transformed functions. If students say the x intercepts I ask why the x intercepts. At this point students explain that these are on the midline of  $y = \sin x$ . As class ends I explain that we will use what they noticed with graphing to graph functions that are transformed. Any students that have not graphed  $y = \cos x$  and compared the graph to  $y = \sin x$  are asked to complete this task as homework.

## Graphing Trigonometric Functions | Purplemath

Let's start with the basic sine function,  $f(t) = \sin(t)$ . This function has an amplitude of 1 because the graph goes

one unit up and one unit down from the midline of the graph. This function has a period of  $2\pi$  because the sine wave repeats every  $2\pi$  units.
